### 1. Project Description

This contract covers the supply of all material, labour, plant and equipment for the repair of potholes and road surface within Ray Nkonyeni Municipality. Areas of operation have been sub-divided into four areas namely:

**Depot 01** – Hibberdene to Umtentweni

**Depot 02** – Port Shepstone to St Micheals including Gamalakhe

**Depot 03** – Uvongo to Marina Beach

**Depot 04** – Trafalgar to Port Edward

### 2. General

For the repair of potholes to be effective, a controlled quality- assurance programme must be followed. Each stage of the process should be checked to ensure that it conforms to the requirements for that stage. For pothole repairs, the primary requirements are that:

- a) The fill materials are suitable for the specific Layers
- b) Each layer is properly and adequately compacted to meet density requirements
- c) If HMA is used, the compaction temperatures should not be too low
- d) The final riding quality is acceptable,
- e) The pothole surface does not form a depression after traffic compaction but rather be slightly raised compared with the rest of the road,
- f) All joints are properly sealed
- g) The patch must be aesthetically pleasing.

### 3. Control

- a) Materials must be suitable for the specific layers
- b) The crushed stone, natural gravel or stabilised gravel materials used for filling the potholes should be tested to ensure that they are suitable. It is unlikely that materials from the same source as those originally used in the construction will be available.
- c) The material should then comply with typical requirements for the appropriate material for that layer, as identified in the TRH 4(1996), eg a G1 to G4 for base course or C4 for Sub-base, etc
- d) Locally- available materials to be used should be tested and their properties checked to conform to the necessary requirements, stockpiles should be kept expressly for pothole patching.

### 4. Compaction

- 4.1 The layers should be compacted properly. To minimize the potential for the materials used to repair potholes to further compact under traffic, it is essential that they are compacted properly during patching and the density is controlled. This is usually done using nuclear-density methods (with gravimetric moisture correction), but this is not effective with smaller holes or for very thin, localized surface layers. It is often better to use portable in situ test equipment such as a Rapid Compaction Control Device(RCCD) or Dynamic Cone Penetrometer(DCP) calibrated on the material used for the patch under controlled laboratory conditions.
- 4.2 Any holes left in the patched material by the in situ testing should be filled as well as possible. The actual control compaction of material added to a small patch can be approximately by measuring the quantity (mass) of material and the change in volume in the hole during compaction. Correlation with Laboratory testing using properties such as the bulking factor and refusal density can be assisted in making the necessary estimates.
- 4.3 Hot mix asphalt compaction temperatures must not be too low. A remote digital thermometer should be used to ensure that's the application and compaction temperatures of any HMA are above the lower limit recommended for that particular mix.
- 4.4 Final riding quality should acceptable. A straight edge should be used to ensure that the final patch is not too high (>5-10mm) above the surrounding pavement. A 5 to 10mm "hump" will allow for some traffic compaction without causing a significant effect on riding quality in the longer term.
- 4.5 The pothole surface must not form a depression. No patch should exhibit any depression under the straight edge before traffic compaction occurs, as any additional compaction will have a detrimental effect on the riding quality of the road.
- 4.6 Joins should be sealed properly. All patches should be inspected to ensure that there are no open joints between the patch and the surrounding material. It is strongly recommended that a geosynthetic strip be glued with bitumen emulsion over the joints and then painted with bitumen emulsion and blinded with coarse sand.
- 4.7 The patch must be aesthetically pleasing. The final patch should blend into the road as far as possible and should have the appearance of a well – engineered product. eg straight edge and smooth finish.

## 5. Field Test Equipment

To carryout appropriate quality control, various simple pieces of equipment must be used.

These include:

- A straight edge and wedge
- A digital thermometer for measuring asphalt temperature
- A simple device for assessing the compaction of gravels and stabilised materials(RCCD or DCP)
- A method for checking the adhesion of cracks sealing material and geosynthetic strips
- A camber board to ensure that pothole patches near the edges of the road are constructed to the correct camber and do not interfere with road surface drainage

## CERTIFICATE OF INDEPENDENT BID DETERMINATION

1. This Municipal Bidding Document (MBD) must form part of all bids<sup>1</sup> invited.
2. Section 4 (1) (b) (iii) of the Competition Act No. 89 of 1998, as amended, prohibits an agreement between, or concerted practice by, firms, or a decision by an association of firms, if it is between parties in a horizontal relationship and if it involves collusive bidding (or bid rigging).<sup>2</sup> Collusive bidding is a *pe se* prohibition meaning that it cannot be justified under any grounds.
3. Municipal Supply Regulation 38 (1) prescribes that a supply chain management policy must provide measures for the combating of abuse of the supply chain management system, and must enable the accounting officer, among others, to:
  - (a) take all reasonable steps to prevent such abuse;
  - (b) reject the bid of any bidder if that bidder or any of its directors has abused the supply chain management system of the municipality or municipal entity or has committed any improper conduct in relation to such system; and
  - (c) cancel a contract awarded to a person if the person committed any corrupt or fraudulent act during the bidding process or the execution of the contract.
4. This MBD serves as a certificate of declaration that would be used by institutions to ensure that, when bids are considered, reasonable steps are taken to prevent any form of bid-rigging.
5. In order to give effect to the above, the attached Certificate of Bid Determination (MBD 9) must be completed and submitted with the bid:

<sup>1</sup>Includes price quotations, advertised competitive bids, limited bids and proposals.

<sup>2</sup> Bid rigging (or collusive bidding) occurs when businesses, that would otherwise be expected to compete, secretly conspire to raise prices or lower the quality of goods and / or services for purchasers who wish to acquire goods and / or services through a bidding process. Bid rigging is, therefore, an agreement between competitors not to compete.

  9. The terms of the accompanying bid have not been, and will not be, disclosed by the bidder, directly or indirectly, to any competitor, prior to the date and time of the official bid opening or of the awarding of the contract.
